MÓDULO C: MOVILIDAD DEL ENCUESTADO	
ENCUESTADOR: Este módulo solo se aplica al encuestado	
SERVICIOS Y COMERCIO	P.30. Le voy a nombrar una serie de servicios y comercios, y para cada uno de ellos, me gustaría que me dijera si es posible encontrarlos en su barrio, o si es necesario salir del barrio para encontrarlos en otros sectores de la comuna 1. Hay en el barrio → → Continuar con P.31 2. Hay que salir del barrio → Pasar a P.32
1. Parques y plazas	<input type="checkbox"/> 1 <input type="checkbox"/> 2
2. Café o restaurant	<input type="checkbox"/> 1 <input type="checkbox"/> 2
3. Farmacia	<input type="checkbox"/> 1 <input type="checkbox"/> 2
4. Consultorio o centro médico público	<input type="checkbox"/> 1 <input type="checkbox"/> 2
5. Consultas de salud privadas	<input type="checkbox"/> 1 <input type="checkbox"/> 2
6. Cajero automático o banco	<input type="checkbox"/> 1 <input type="checkbox"/> 2
7. Establecimiento educacional	<input type="checkbox"/> 1 <input type="checkbox"/> 2
8. Sede social o comunitaria	<input type="checkbox"/> 1 <input type="checkbox"/> 2
9. Centros culturales, como cine, teatro, biblioteca, museo u otro	<input type="checkbox"/> 1 <input type="checkbox"/> 2
10. Centro deportivo o infraestructura como multicanchas	<input type="checkbox"/> 1 <input type="checkbox"/> 2
11. Punto de Recarga Bip	<input type="checkbox"/> 1 <input type="checkbox"/> 2
12. Supermercado	<input type="checkbox"/> 1 <input type="checkbox"/> 2

# Café & Restaurants

26% There are facilities and I visit them...

31% There are facilities but I don't visit them...

43% There are no facilities...

in the neighbourhood

# (Some) research questions

Is it possible to understand what “the neighbourhood” means based on the answers to these questions?

Is there any “systematic” perception of this neighbourhood concept?

Is it possible to predict the perception of each service existence within each individual neighbourhood?

# The team

# Context

## 1. Normative accessibility (Hansen, 1959)

All potential opportunities and desirable thresholds

## 2. Positive accessibility (Páez et al., 2012)

How people travel within the city

## 3. Perceived accessibility (Lättman et al., 2016)

How easy is to live a satisfactory life considering convenience

# Generating the dataset

# Location of services and facilities

12 services:

green areas – café & restaurants – pharmacies – public health centers  
private health centers – atm & banks – educational centers – community centers  
cultural centers – sport centers – bip! top-up place - supermarkets

# Location of services and facilities

8 services:

green areas – café & restaurants – pharmacies – public health centers  
private health centers – atm & banks – educational centers – community centers  
cultural centers – sport centers – bip! top-up place - supermarkets

# Location of services and facilities

OpenStreetMap

filtered by categories

GoogleMaps API

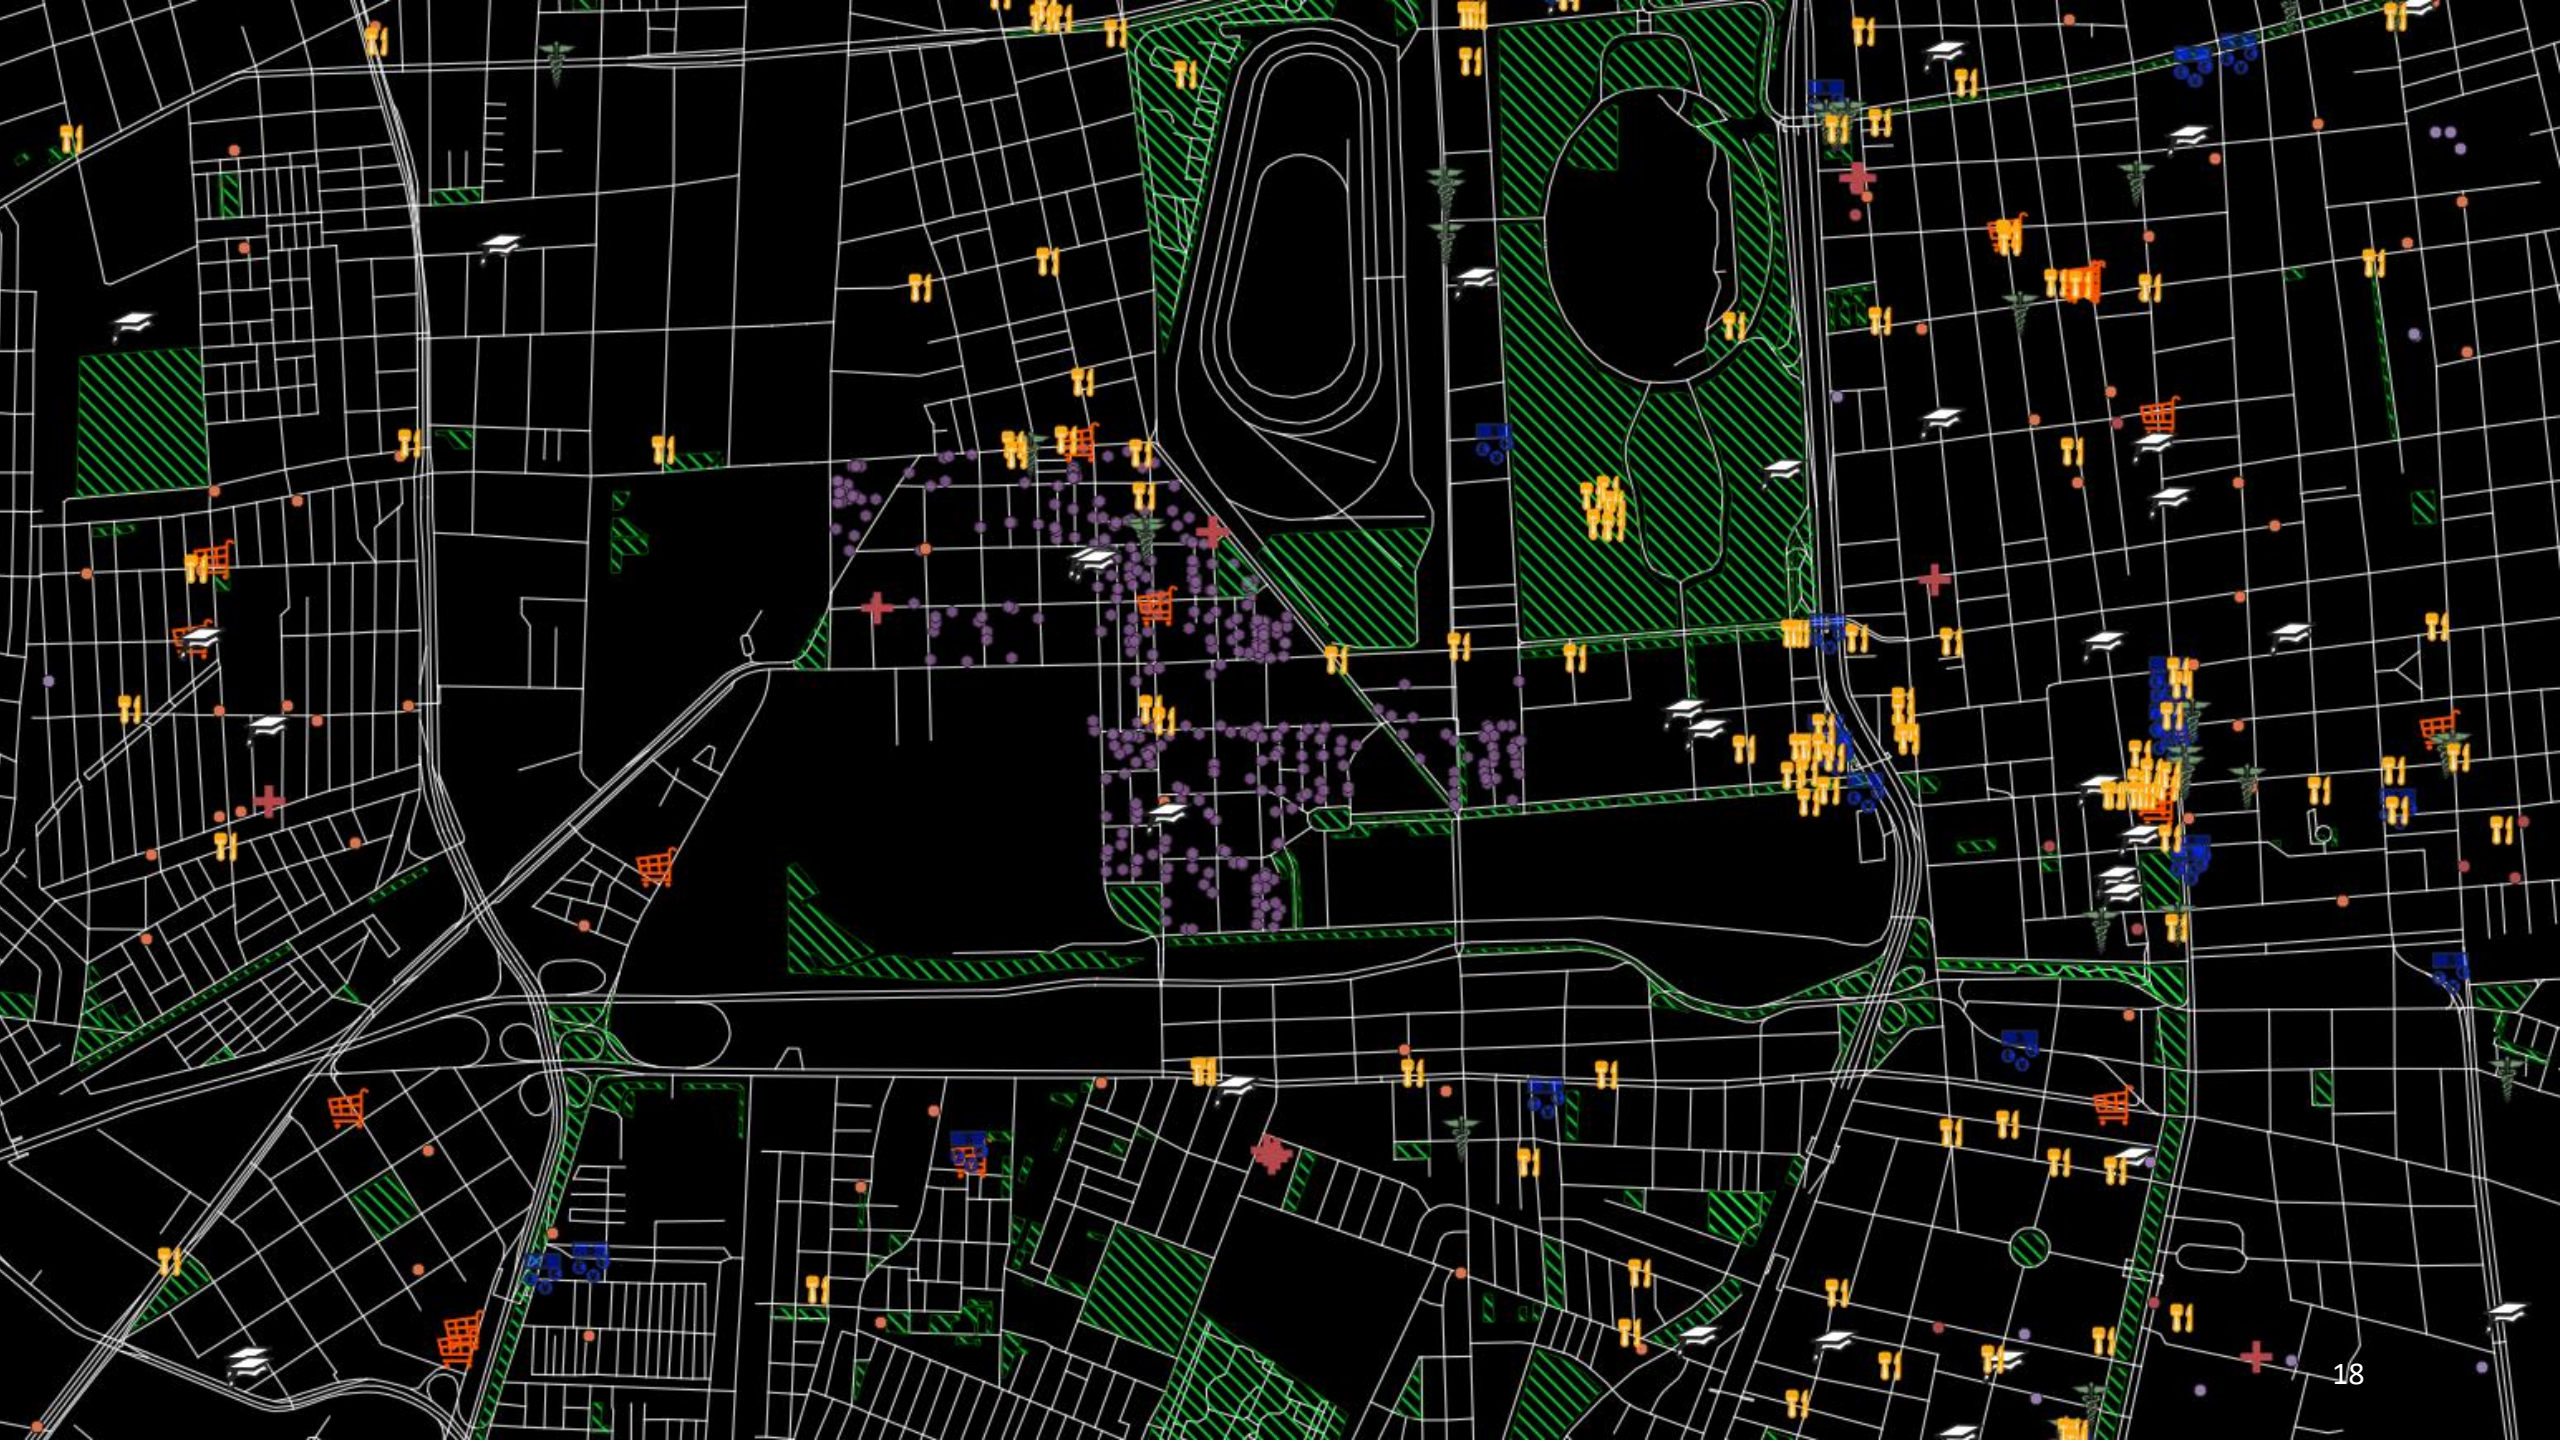

queries by type:

“health”, “education”

queries by specific concept:

“centro+salud+familiar”

Specific shapefiles: bip! & green areas

# Household - facility walking distance

Python script – osmnx package

Downloaded graph from center to  
7km network distance

Computed shortest path matrix

Assigned to each household and  
service facility the closest node

# Household - facility walking distance

Four buffer areas: 300m, 500m, 800m, 1000m

4.5 min ,7.5 min ,12 min ,15 min at 4km/hr

Accessibility indicators:

for each individual

for each service

for each walking distance threshold

# facilities

average distance

# Accessibility responses

Three accessibility levels were defined

For each service:

there are facilities in my neighborhood

usage?: yes

→ level I

usage?: no

→ level II

there are no facilities in my neighborhood

→ level III

# Latent perceptions

25 statements about how frequent are some situations regarding:  
streets, sidewalks, and green areas.

Ordered answers: yes, always / sometimes / no, never

PCA & FA: 1/3 of the variance is explained with 3 factors

# Latent perceptions

## Factor 1: Infrastructure quality

“The quality of the sidewalks allows safe movement of every person, including baby strollers, wheel-chairs, and elder people”

“There are urban facilities (like benches) that allow pedestrians to rest”

“ Cross-walks are safe and respected by car-drivers ”

# Latent perceptions

## Factor 2: Cycle-friendly neighborhood

“The quality of the bikeways allows safe transit of cyclists”

“Existent bikeways are well connected and are part of a network”

“Cyclists respect pedestrians and transit exclusively on bikeways or at the street”

# Latent perceptions

## Factor 3: Usage of public spaces

“I see kids playing in the parks and squares of the neighborhood”

“I see groups of neighbors talking in the sidewalks”

“I use the parks and squares of the neighborhood”

# Modelling & early results

# Modelling

Ordinal logit model

“Specific constants” for each type of service

Accessibility indicator + SE information as explanatory variables

$$V_{i,s} = Acc_{i,s} + SE_i + SC_s$$

# Early results

Proposed model is significantly better than a model with constants only

Likelihood decreases when distance threshold increases

Best models so far: 300m threshold

Two accessibility indicators performed better:

$$Acc_{i,s} = \#facilities_{i,s} \qquad Acc_{i,s} = \#facilities_{i,s} \cdot \frac{\#facilities_{i,s}}{\text{distance}_{i,s}}$$

Joint model indicates that the second measure is better

# Early results

No gender differences

Age has a significant impact in accessibility perception

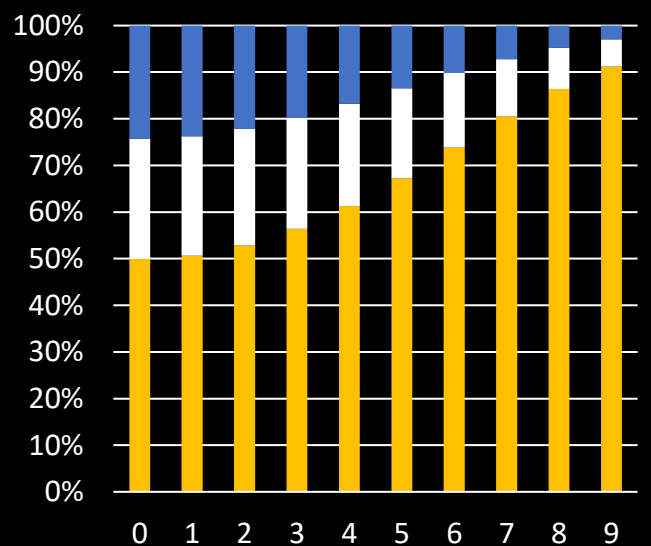

Around (~35% ,~55%) more probable  
to answer there are no facilities

# Early results

# Facilities effect:

fixed distance: 150 m

# Early results

Distance effect:

Corrects the prediction for low average distance individuals

Ongoing work

# Ongoing work

Some unexplored paths...

Distance threshold

Continuous threshold?
